F²MC-16FX, CY96340 Series, 16-bit Proprietary Microcontroller Datasheet

CY96340 series is based on Cypress advanced 16FX architecture (16-bit with instruction pipeline for RISC-like performance). The CPU uses the same instruction set as the established 16LX series - thus allowing for easy migration of 16LX Software to the new 16FX products. 16FX improvements compared to the previous generation include significantly improved performance - even at the same operation frequency, reduced power consumption and faster start-up time.

For highest processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 56MHz operation frequency from an external 4MHz resonator. The result is a minimum instruction cycle time of 17.8ns going together with excellent EMI behavior. An on-chip clock modulation circuit significantly reduces emission peaks in the frequency spectrum. The emitted power is minimized by the on-chip voltage regulator that reduces the internal CPU voltage. A flexible clock tree allows to select suitable operation frequencies for peripheral resources independent of the CPU speed.

Features

Technology

- 0.18µm CMOS

CPU

- F²MC-16FX CPU
- Up to 56 MHz internal, 17.8 ns instruction cycle time
- Optimized instruction set for controller applications (bit, byte, word and long-word data types; 23 different addressing modes; barrel shift; variety of pointers)
- 8-byte instruction execution queue
- Signed multiply (16-bit × 16-bit) and divide (32-bit/16-bit) instructions available

System clock

- On-chip PLL clock multiplier (x1 - x25, x1 when PLL stop)
- 3 MHz - 16 MHz external crystal oscillator clock (maximum frequency when using ceramic resonator depends on Q-factor).
- Up to 56 MHz external clock for devices with fast clock input feature
- 32-100 kHz subsystem quartz clock
- 100kHz/2MHz internal RC clock for quick and safe startup, oscillator stop detection, watchdog
- Clock source selectable from main- and subclock oscillator (part number suffix “W”) and on-chip RC oscillator, independently for CPU and 2 clock domains of peripherals.
- Low Power Consumption - 13 operating modes : (different Run, Sleep, Timer modes, Stop mode)
- Clock modulator

On-chip voltage regulator

- Internal voltage regulator supports reduced internal MCU voltage, offering low EMI and low power consumption figures

Low voltage reset

- Reset is generated when supply voltage is below minimum

Code Security

- Protects ROM content from unintended read-out

Memory Patch Function

- Replaces ROM content
- Can also be used to implement embedded debug support

DMA

- Automatic transfer function independent of CPU, can be assigned freely to resources

Interrupts

- Fast Interrupt processing
- 8 programmable priority levels
- Non-Maskable Interrupt (NMI)

Timers

- Three independent clock timers (23-bit RC clock timer, 23-bit Main clock timer,
  17-bit Sub clock timer)
- Watchdog Timer

CAN

- Supports CAN protocol version 2.0 part A and B
- ISO16845 certified
- Bit rates up to 1 Mbit/s
- 32 message objects
- Each message object has its own identifier mask
- Programmable FIFO mode (concatenation of message objects)
- Maskable interrupt
- Disabled Automatic Retransmission mode for Time Triggered CAN applications
- Programmable loop-back mode for self-test operation

USART

- Full duplex USARTs (SCI/LIN)
- Wide range of baud rate settings using a dedicated reload timer
- Special synchronous options for adapting to different synchronous serial protocols
- LIN functionality working either as master or slave LIN device

I²C

- Up to 400 kbps
- Master and Slave functionality, 8-bit and 10-bit addressing

A/D converter

- SAR-type
- 10-bit resolution
- Signals interrupt on conversion end, single conversion mode, continuous conversion mode, stop conversion mode, activation by software, external trigger or reload timer

A/D Converter Reference Voltage switch

- 2 independent positive A/D converter reference voltages available

Reload Timers

- 16-bit wide
- Prescaler with $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$ of peripheral clock frequency
- Event count function

Free Running Timers

- Signals an interrupt on overflow, supports timer clear upon match with Output Compare (0, 4), Prescaler with 1, $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$, $1/2^7$,$1/2^8$ of peripheral clock frequency

Input Capture Units

- 16-bit wide
- Signals an interrupt upon external event
- Rising edge, falling edge or rising & falling edge sensitive

Output Compare Units

- 16-bit wide
- Signals an interrupt when a match with 16-bit I/O Timer occurs
- A pair of compare registers can be used to generate an output signal.

Programmable Pulse Generator

- 16-bit down counter, cycle and duty setting registers
- Interrupt at trigger, counter borrow and/or duty match
- PWM operation and one-shot operation
- Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock and Reload timer overflow as clock input
- Can be triggered by software or reload timer

Real Time Clock

- Can be clocked either from sub oscillator (devices with part number suffix “W”), main oscillator or from the RC oscillator
- Facility to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)
- Read/write accessible second/minute/hour registers
- Can signal interrupts every half second/second/minute/hour/day
- Internal clock divider and prescaler provide exact 1s clock

External Interrupts

- Edge sensitive or level sensitive
- Interrupt mask and pending bit per channel
- Each available CAN channel RX has an external interrupt for wake-up
- Selected USART channels SIN have an external interrupt for wake-up

Non Maskable Interrupt

- Disabled after reset
- Once enabled, can not be disabled other than by reset.
- Level high or level low sensitive
- Pin shared with external interrupt 0.

External bus interface

- 8-bit or 16-bit bidirectional data
- Up to 24-bit addresses
- 6 chip select signals
- Multiplexed address/data lines
- Wait state request
- External bus master possible
- Timing programmable

Alarm comparator

- Monitors an external voltage and generates an interrupt in case of a voltage lower or higher than the defined thresholds
- Threshold voltages defined externally or generated internally
- Status is readable, interrupts can be masked separately

I/O Ports

- Virtually all external pins can be used as general purpose I/O
- All push-pull outputs (except when used as I2C SDA/SCL line)
- Bit-wise programmable as input/output or peripheral signal
- Bit-wise programmable input enable
- Bit-wise programmable input levels: Automotive / CMOS-Schmitt trigger / TTL (TTL levels not supported by all devices)
- Bit-wise programmable pull-up resistor
- Bit-wise programmable output driving strength for EMI optimization

Packages

- 100-pin plastic QFP and LQFP

Flash Memory

- Supports automatic programming, Embedded Algorithm
- Write/Erase/Erase-Suspend/Resume commands
- A flag indicating completion of the algorithm
- Number of erase cycles: 10,000 times
- Data retention time: 20 years
- Erase can be performed on each sector individually
- Sector protection
- Flash Security feature to protect the content of the Flash
- Low voltage detection during Flash erase

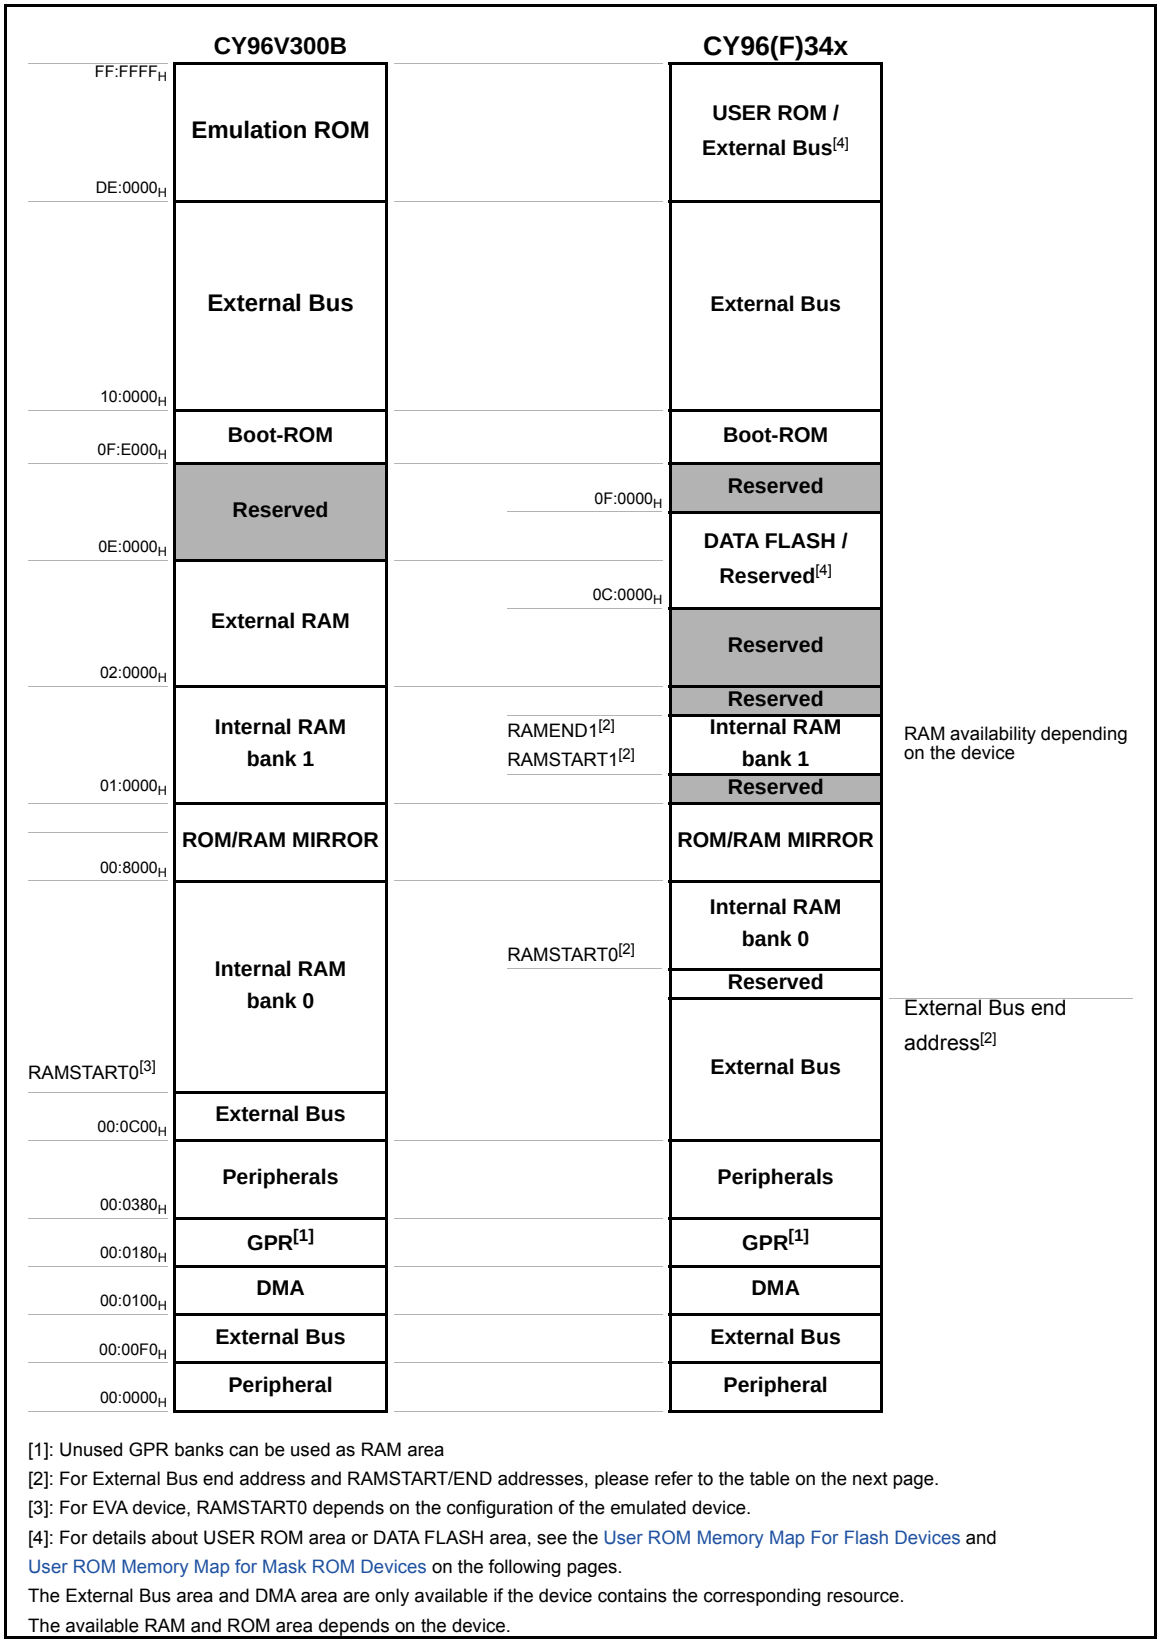
6. I/O Circuit Type

Type	Circuit	Remarks
A		High-speed oscillation circuit: ■ Programmable between oscillation mode (external crystal or resonator connected to X0/X1 pins) and Fast external Clock Input (FCI) mode (external clock connected to X0 pin) ■ Programmable feedback resistor = approx. 2 * 0.5 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled or in FCI mode
B		Low-speed oscillation circuit: ■ Programmable feedback resistor = approx. 2 * 5 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled
C		■ Mask ROM and EVA device:CMOS Hysteresis input pin ■ Flash device:CMOS input pin
E		■ CMOS Hysteresis input pin ■ Pull-up resistor value: approx. 50 kΩ

Type	Circuit	Remarks
F		■ Power supply input protection circuit
G		■ A/D converter ref+ (AVRH/AVRH2) power supply input pin with protection circuit ■ Flash devices do not have a protection circuit against VCC for pins AVRH/AVRH2 ■ Devices without AVRH reference switch do not have an analog switch for the AVRL pin
H		■ CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) ■ 2 different CMOS hysteresis inputs with input shutdown function * ■ Automotive input with input shutdown function ■ TTL input with input shutdown function * ■ Programmable pull-up resistor: 50kΩ approx. *CY96F345Dyy or CY96F345Fyy: Only Automotive input and CMOS hysteresis input (0.7/0.3) are supported

Type	Circuit	Remarks
I		■ CMOS level output (programmable I_{OL} = 5mA, I_{OH} = -5mA and I_{OL} = 2mA, I_{OH} = -2mA) ■ 2 different CMOS hysteresis inputs with input shutdown function * ■ Automotive input with input shutdown function ■ TTL input with input shutdown function * ■ Programmable pull-up resistor: 50kΩ approx. ■ Analog input *CY96F345Dyy or CY96F345Fyy: Only Automotive input and CMOS hysteresis input (0.7/0.3) are supported
N		■ CMOS level output (I_{OL} = 3mA, I_{OH} = -3mA) ■ 2 different CMOS hysteresis inputs with input shutdown function * ■ Automotive input with input shutdown function ■ TTL input with input shutdown function * ■ Programmable pull-up resistor: 50kΩ approx. *CY96F345Dyy or CY96F345Fyy: Only Automotive input and CMOS hysteresis input (0.7/0.3) are supported

7. Memory Map



[1]: Unused GPR banks can be used as RAM area

[2]: For External Bus end address and RAMSTART/END addresses, please refer to the table on the next page.

[3]: For EVA device, RAMSTART0 depends on the configuration of the emulated device.

[4]: For details about USER ROM area or DATA FLASH area, see the User ROM Memory Map For Flash Devices and User ROM Memory Map for Mask ROM Devices on the following pages.

The External Bus area and DMA area are only available if the device contains the corresponding resource.

The available RAM and ROM area depends on the device.

Note: If a Flash programmer and its software needs to use a handshaking pin, Cypress suggests to the tool vendor to support at least port P00_1 on pin 76/78.If handshaking is used by the tool but P00_1 is not available in customer's application, Cypress suggests to the customer to check the tool manual or to contact the tool vendor for alternative handshaking pins.

13. Handling Devices

Special care is required for the following when handling the device:

- Latch-up prevention
- Unused pins handling
- External clock usage
- Unused sub clock signal
- Notes on PLL clock mode operation
- Power supply pins (V_{CC}/V_{SS})
- Crystal oscillator circuit
- Turn on sequence of power supply to A/D converter and analog inputs
- Pin handling when not using the A/D converter
- Notes on energization
- Stabilization of power supply voltage
- Serial communication
- Handling of Data Flash

13.1 Latch-up prevention

CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than V_{CC} or lower than V_{SS} is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between V_{CC} pins and V_{SS} pins.
- The AV_{CC} power supply is applied before the V_{CC} voltage.

Latch-up may increase the power supply current dramatically, causing thermal damages to the device.

For the same reason, extra care is required to not let the analog power-supply voltage (AV_{CC}, AVRH) exceed the digital power-supply voltage.

13.2 Unused pins handling

Unused input pins can be left open when the input is disabled (corresponding bit of Port Input Enable register PIER = 0).

Leaving unused input pins open when the input is enabled may result in misbehavior and possible permanent damage of the device. They must therefore be pulled up or pulled down through resistors. To prevent latch-up, those resistors should be more than 2 kΩ.

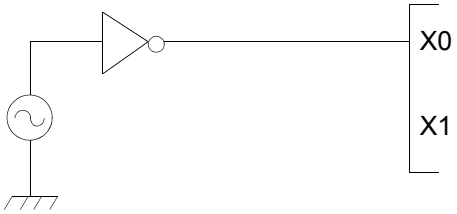
Unused bidirectional pins can be set either to the output state and be then left open, or to the input state with either input disabled or external pull-up/pull-down resistor as described above.

13.3 External clock usage

The permitted frequency range of an external clock depends on the oscillator type and configuration. See AC Characteristics for detailed modes and frequency limits. Single and opposite phase external clocks must be connected as follows:

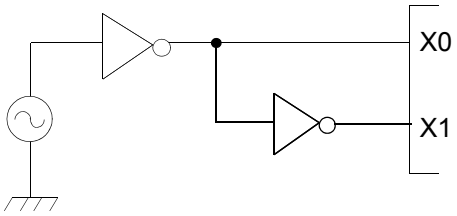
13.3.1 Single phase external clock

■ When using a single phase external clock, X0 pin must be driven and X1 pin left open.



13.3.2 Opposite phase external clock

■ When using an opposite phase external clock, X1 (X1A) must be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins.



13.4 Unused sub clock signal

If the pins X0A and X1A are not connected to an oscillator, a pull-down resistor must be connected on the X0A pin and the X1A pin must be left open.

13.5 Notes on PLL clock mode operation

If the PLL clock mode is selected and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

13.6 Power supply pins (V_{CC}/V_{SS})

It is required that all V_{CC}-level as well as all V_{SS}-level power supply pins are at the same potential. If there is more than one V_{CC} or V_{SS} level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

V_{CC} and V_{SS} must be connected to the device from the power supply with lowest possible impedance.

As a measure against power supply noise, it is required to connect a bypass capacitor of about 0.1 µF between V_{CC} and V_{SS} as close as possible to V_{CC} and V_{SS} pins.

13.7 Crystal oscillator and ceramic resonator circuit

Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

13.8 Turn on sequence of power supply to A/D converter and analog inputs

It is required to turn the A/D converter power supply (AV_{CC}, AVRH, AVRL) and analog inputs (ANn) on after turning the digital power supply (V_{CC}) on.

It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, the voltage must not exceed AVRH or AV_{CC} (turning the analog and digital power supplies simultaneously on or off is acceptable).

13.9 Pin handling when not using the A/D converter

It is required to connect the unused pins of the A/D converter as $AV_{CC} = V_{CC}$, AV_{SS} = AVRH = AVRL = V_{SS}.

13.10 Notes on Power-on

To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than 50µs from 0.2 V to 2.7 V.

13.11 Stabilization of power supply voltage

If the power supply voltage varies acutely even within the operation safety range of the Vcc power supply voltage, a malfunction may occur. The Vcc power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that Vcc ripple fluctuations (peak to peak value) in the commercial frequencies (50 to 60 Hz) fall within 10% of the standard Vcc power supply voltage and the transient fluctuation rate becomes 0.1V/µs or less in instantaneous fluctuation for power supply switching.

13.12 Serial communication

There is a possibility to receive wrong data due to noise or other causes on the serial communication.Therefore, design a printed circuit board so as to avoid noise.Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

13.13 Handling of Data Flash

The Data Flash requires different and additional control signals for parallel programming. Please check with your programming equipment maker for support of this interface.

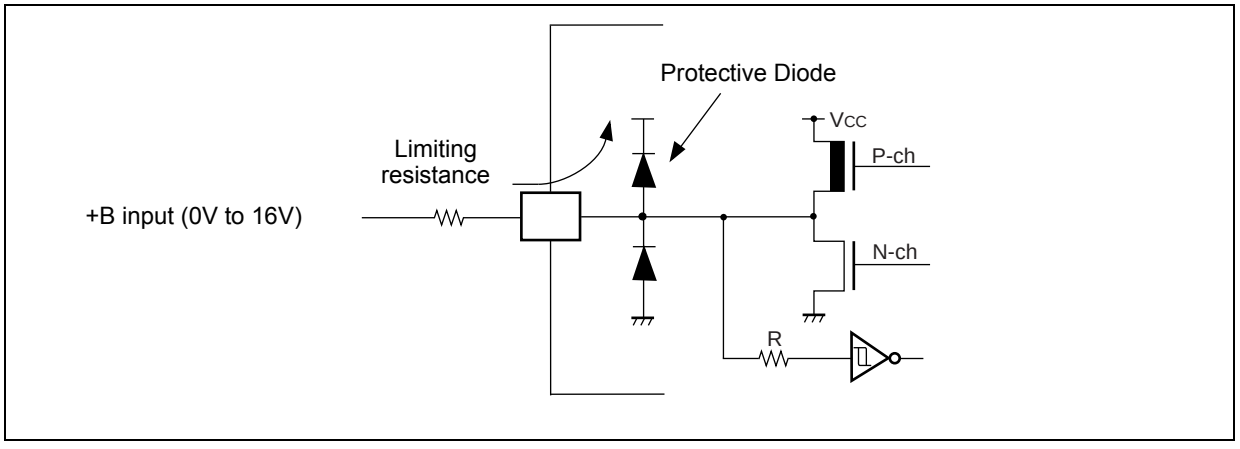
[1]: AV_{CC} and V_{CC} must be set to the same voltage. It is required that AV_{CC} does not exceed V_{CC} and that the voltage at the analog inputs does not exceed AV_{CC} neither when the power is switched on.

[2]: V_I and V_O should not exceed V_{CC} + 0.3 V. V_I should also not exceed the specified ratings. However if the maximum current to/from a input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating. Input/output voltages of standard ports depend on V_{CC}.

[3]:

- Applicable to all general purpose I/O pins (Pnn_m)
- Use within recommended operating conditions.
- Use at DC voltage (current)
- The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this may affect other devices.
- Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset (except devices with persistent low voltage reset in internal vector mode).

Sample recommended circuits:



[4]: The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.The actual power dissipation depends on the customer application and can be calculated as follows:
$P_D = P_{IO} + P_{INT}$
$P_{IO} = \Sigma (V_{OL} * I_{OL} + V_{OH} * I_{OH})$ (IO load power dissipation, sum is performed on all IO ports)
$P_{INT} = V_{CC} * (I_{CC} + I_A)$ (internal power dissipation)
I_{CC} is the total core current consumption into V_{CC} as described in the “DC characteristics” and depends on the selected operation mode and clock frequency and the usage of functions like Flash programming or the clock modulator.I_A is the analog current consumption into AV_{CC}.

[5]: Worst case value for a package mounted on single layer PCB at specified T_A without air flow.

[6]: Please contact Cypress for reliability limitations when using under these conditions.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed any of these ratings.

14.2 Recommended Operating Conditions

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	V_{CC}	3.0	-	5.5	V	
Smoothing capacitor at C pin	C_S	3.5	4.7 - 10	15	µF	Use a low inductance capacitor (for example X7R ceramic capacitor)

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

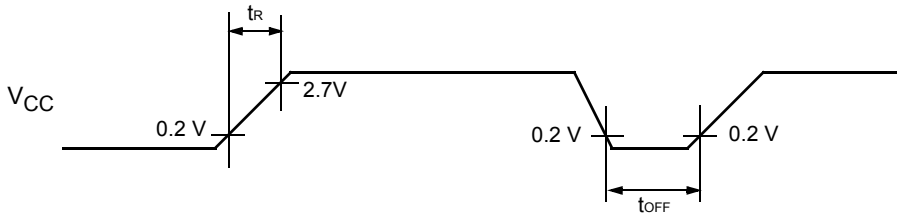
14.4.4 Power On Reset timing

(T_A = -40°C to 125°C, V_{CC} = AV_{CC} = 3.0V to 5.5V, V_{SS} = AV_{SS} = 0V)

Parameter	Symbol	Pin	Value			Unit	Remarks
			Min	Typ	Max		
Power on rise time	t_R	Vcc	0.05	-	30	ms	
Power off time	t_{OFF}	Vcc	1	-	-	ms	



If the power supply is changed too rapidly, a power-on reset may occur.
We recommend a smooth startup by restraining voltages when changing the power supply voltage during operation, as shown in the figure below.

14.4.5 External Input timing

Notes:

- AC characteristic in CLK synchronized mode.
- C_L is the load capacity value of pins when testing.
- Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters. These parameters are shown in “CY96300 Super series HARDWARE MANUAL”.
- t_{CLKP1} is the cycle time of the peripheral clock 1 (CLKP1), Unit : ns

[1]: Parameter N depends on t_{SCYCI} and can be calculated as follows:

- if t_{SCYCI} = 2*k*t_{CLKP1}, then N = k, where k is an integer > 2
- if t_{SCYCI} = (2*k+1)*t_{CLKP1}, then N = k+1, where k is an integer > 1

Examples:

t_{SCYCI}	N
4*t_{CLKP1}	2
5*t_{CLKP1},	3
7*t_{CLKP1},	4

[1] : R,C: Pull-up resistor and load capacitor of the SCL and SDA lines.

[2]: The maximum t_{HDDAT} have only to be met if the device does not stretch the "L" width (t_{LOW}) of the SCL signal.

[3] : A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement t_{SUDAT}≥ 250 ns must then be met.

[4] : For use at over 100 kHz, set the peripheral clock 1 to at least 6 MHz.

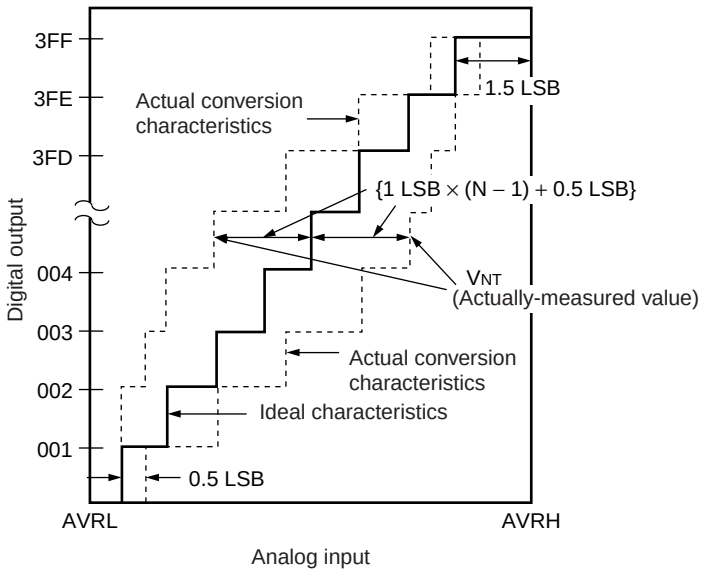
14.5.1 Definition of A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Total error: Difference between the actual value and the ideal value. The total error includes zero transition error, full-scale transition error and nonlinearity error.
- Nonlinearity error: Deviation between a line across zero-transition line (“00 0000 0000” <--> “00 0000 0001”) and full-scale transition line (“11 1111 1110” <--> “11 1111 1111”) and actual conversion characteristics.
- Differential nonlinearity error: Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Zero reading voltage: Input voltage which results in the minimum conversion value.
- Full scale reading voltage: Input voltage which results in the maximum conversion value.

Total error



$$\text{Total error of digital output “N”} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}}\ [\text{LSB}]$$

$$1\ \text{LSB} = (\text{Ideal value})\ \frac{AVRH - AVRL}{1024}\ [\text{V}]$$

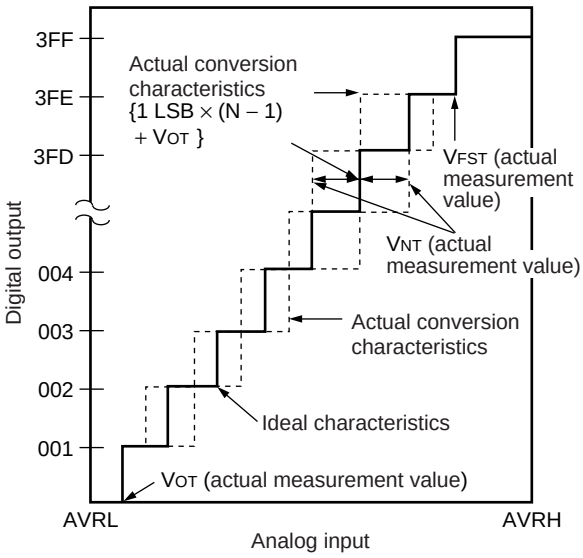
N: A/D converter digital output value

V_{OT} (Ideal value) = AVRL + 0.5 LSB [V]

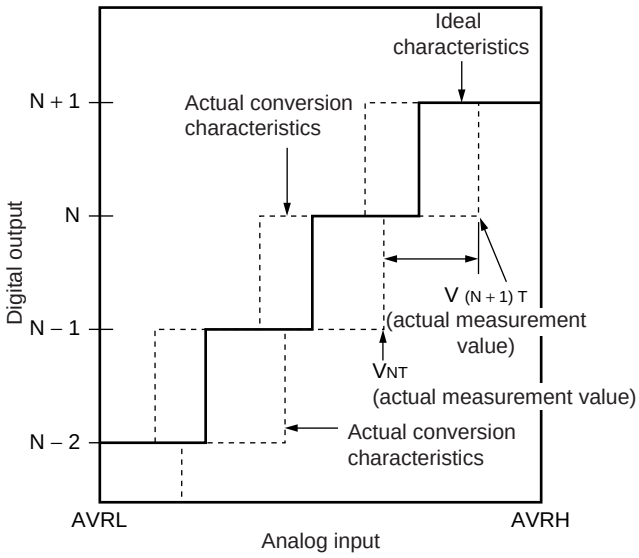
V_{FST} (Ideal value) = AVRH – 1.5 LSB [V]

V_{NT} : A voltage at which digital output transitions from (N – 1) to N.

Nonlinearity error



Differential nonlinearity error



$$\text{Nonlinearity error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N - 1) + V_{OT}\}}{1\ \text{LSB}}\ [\text{LSB}]$$

$$\text{Differential nonlinearity error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\ \text{LSB}} - 1\text{LSB}\ [\text{LSB}]$$

$$1\ \text{LSB} = \frac{V_{FST} - V_{OT}}{1022}\ [\text{V}]$$

N: A/D converter digital output value

V_{OT}: Voltage at which digital output transits from "000_H" to "001_H."

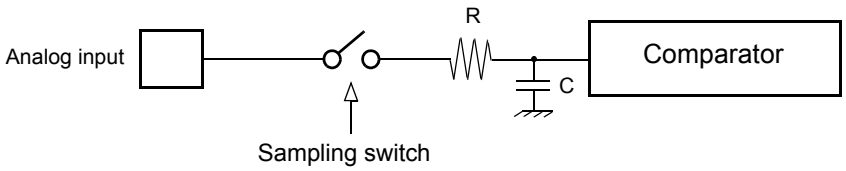
V_{FST}: Voltage at which digital output transits from "$3FE_H$" to "$\#FF_H$."

14.5.2 Notes on A/D Converter Section

■ About the external impedance of the analog input and the sampling time of the A/D converter (with sample and hold circuit):

If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision.

Analog input circuit model:



Reference value:
C = 8.5 pF (Max)

To satisfy the A/D conversion precision standard, the relationship between the external impedance and minimum sampling time must be considered and then either the resistor value and operating frequency must be adjusted or the external impedance must be decreased so that the sampling time (T_{samp}) is longer than the minimum value. Usually, this value is set to 7τ, where τ = RC. If the external input resistance (R_{ext}) connected to the analog input is included, the sampling time is expressed as follows:

T_{samp} [min] = 7 ∞ (R_{ext} + 2.6kΩ) × C for 4.5 ≤ AV_{cc} ≤ 5.5

T_{samp} [min] = 7 ∞ (R_{ext} + 12.1kΩ) × C for 3.0 ≤ AV_{cc} ≤ 4.5

If the sampling time cannot be sufficient, connect a capacitor of about 0.1 μF to the analog input pin.

■ About the error

The accuracy gets worse as |AVRH - AVRL| becomes smaller.

[2]: valid for: CY96F345

CILCR:LVL[3:0] are the low voltage detector level select bits of the CILCR register.

Levels 10 to 15 are not used in this device.

For correct detection, the slope of the voltage level must satisfy $\left|\frac{dV}{dt}\right| \leq 0.004\frac{V}{\mu s}$.

Faster variations are regarded as noise and may not be detected.

The functional operation of the MCU is guaranteed down to the minimum low voltage detection level of Vcc = 2.7V. The electrical characteristics however are only valid in the specified range (usually down to 3.0V).

14.7.1 Low Voltage Detector Operation

In the following figure, the occurrence of a low voltage condition is illustrated. For a detailed description of the reset and startup behavior, please refer to the corresponding hardware manual chapter.

Revision	Date	Modification
Prelim 1	2007-05-07	Creation
Prelim 2	2007-05-10	External bus hold timing update
Prelim 3	2007-05-23	Electrical characteristics updates
Prelim 4	2007-08-02	Electrical characteristics updates, Product lineup, changes and ordering information
Prelim 5	2007-09-12	Addition of the electrical characteristic examples and the LVD characteristics specifications, updates of the DC characteristics. Pin circuit type drawing modifications.
Prelim 6	2007-11-21	LVD typo correction. Update of the DC characteristics. Typos corrections.
Prelim 7	2007-12-04	Absolute maximum rating asterisks numbering corrected. Typos page 59: Hardware -> Hardware. IO map table regenerated. Typos corrections. IO circuit drawings modified. Renaming of the Main/Satellite Flash into Flash memory A/B. Memory map reworked.
Prelim 8	2008-02-04	■ Satellite Flash -> 32kB Data Flash ■ MB96345 added (under development) ■ MB96F348 TSA/HSA/TWA/HWA removed (outdated devices) ■ Block diagram and pin assignment corrected (existing resource pins) ■ Pin function table corrected ■ I/O circuit type diagrams corrected ■ Memory map cleaned up ■ "Flash sector configuration" replaced by corrected "User ROM Memory map for Flash devices", “ROM configuration” replaced by “User ROM Memory map for Mask ROM devices” ■ Parallel Flash programming pinning removed ■ IO map table regenerated: ❒ Port register: Naming style corrected ❒ Memory control registers renamed (Main/Sat -> A/B) ❒ addresses after 000BFFh removed ■ Absolute maximum ratings: Pd and Ta specified more precisely ■ oscillator input levels in oscillation mode with external clock added ■ Run and Sleep mode currents: 96/48MHz and 72/36MHz settings added ■ Run mode current spec in 48/24MHz mode corrected ■ Maximum CLKS1/2 frequency for all devices correctly specified ■ Maximum CLKP2 for MB96F34xY/R/Axx corrected ■ External bus timings: missing conditions added and readability improved ■ Alarm comparator spec updated (transition voltages defined) ■ MB96V300A removed ■ Ordering information updated ■ Typos and formatting corrected

Revision	Date	Modification
9	2009-01-09	■ Format adjusted to official Cypress datasheet standard (mainly style changes and official notes and disclaimer added) ■ Numbering of Electrical Characteristics subchapters automated ■ Note about devices under development modified ■ I/O map: Note added about reserved addresses ■ ICCSPLL for CLKS1=96MHz mode: increased by 1mA ■ Serial programming interface: Note about handshaking pins improved ■ specified AD converter channel offset to 4LSB ■ package code of MB96V300 corrected in ordering information ■ Added voltage condition to pull-up resistance spec ■ Lineup: Term “Data Flash” replaced by “independent 32KB Flash” ■ Ordering information: column “Independent 32KB Data Flash” replaced by new column “Flash/ROM”, column “Remarks” removed ■ Official package dimension drawing with additional notes added ■ Empty pages removed ■ Alarm comparator: Power supply current max values increased, comparison time reduced, mode transition time and power-up stabilization time newly added ■ Handling devices: Notes added about Serial communication and about using ceramic resonators. ■ Feature list and AC Characteristics: 16MHz maximum frequency is valid for crystal oscillators. For resonators, maximum frequency depends on Q-factor ■ AC characteristics: PLL phase skew spec added, CLKVCO min=64MHz ■ VOL3 spec improved: spec valid for 3mA load for full Vcc range ■ MB96F345 added ■ Preliminary DC spec of MB96345/346 added ■ Permitted power dissipation of Flash devices in QFP package improved ■ C-Pin cap spec updated: 4.7uF-10uF capacitor with tolerance permitted ■ “Preliminary” watermark removed
10	To be released	■ I/O map: IOABK0-5 added at address 000A00H-000A05H ■ Ordering Information: Suffix “A” added to all MB96F345 device versions ■ AD converter I_{AIN} spec improved: 1uA valid up to 105deg, 1.2uA above 105deg
