

CAT4201

350 mA High Efficiency Step Down LED Driver

Description

The CAT4201 is a high efficiency step-down converter optimized to drive high current LEDs. A patented switching control algorithm allows highly efficient and accurate LED current regulation. A single RSET resistor sets the full scale LED string current up to 350 mA from supplies as high as 36 V.

The switching architecture of the CAT4201 results in extremely low internal power dissipation allowing the device to be housed in a tiny package without the need for dedicated heat sinking. The device is compatible with switching frequencies of up to 1 MHz, making it ideal for applications requiring small footprint and low value external inductors.

Analog dimming and LED shutdown control is provided via a single input pin, CTRL. Additional features include overload current protection and thermal shutdown. The device is available in the low profile 5-lead thin SOT23 package ideal for space constrained applications.

Features

- LED Drive Current up to 350 mA
- Compatible with 12 V and 24 V Standard Systems
- Handles Transients up to 40 V
- Single Pin Control and Dimming Function
- Power Efficiency up to 94%
- Drives LED Strings of up to 32 V
- Open and Short LED Protection
- Parallel Configuration for Higher Output Current
- TSOT-23 5-lead Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- 12 V and 24 V Lighting Systems
- Automotive and Aircraft Lighting
- General Lighting, High Brightness 350 mA LEDs

See Table 4 on page 6 for external component selection.

ORDERING INFORMATION

| Device | Package | Shipping |
|---------------|-------------------|-----------------------|
| CAT4201TD-GT3 | TSOT-23 (Pb-Free) | 3,000/ Tape & Reel |

* Plated Finish: NiPdAu

CAT4201

Table 1. ABSOLUTE MAXIMUM RATINGS

| Parameters | Ratings | Units |
|----------------------------|-------------|-------|
| VBAT, SW, CTRL | -0.3 to +40 | V |
| RSET | -0.3 to +5 | V |
| Switch SW peak current | 1 | A |
| Storage Temperature Range | -65 to +160 | °C |
| Junction Temperature Range | -40 to +150 | °C |
| Lead Temperature | 300 | °C |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 2. RECOMMENDED OPERATING CONDITIONS

| Parameters | Ratings | Units |
|---------------------------|--------------------|-------|
| VBAT voltage (Notes 1, 2) | 6.5 to 36 (Note 1) | V |
| SW voltage | 0 to 36 | V |
| Ambient Temperature Range | -40 to +125 | °C |
| LED Current | 50 to 350 | mA |
| Switching Frequency | 50 to 1000 | kHz |

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

1. The VBAT pin voltage should be at least 3 V greater than the total sum of the LED forward voltages in order to operate at nominal LED current.
2. During power-up, the slew rate of the input supply should be greater than 1 μ s for every 5 V increase of VBAT.

Table 3. ELECTRICAL CHARACTERISTICS

($V_{IN} = 13$ V, ambient temperature of 25°C (over recommended operating conditions unless otherwise specified))

| Symbol | Parameter | Conditions | Min | Typ | Max | Units |
|-----------------|--------------------------------------|--|------|-------------------|------|----------|
| I_Q | Operating Supply Current on VBAT pin | | | 0.4 | 1 | mA |
| I_{SD} | Idle Mode Supply Current on VBAT pin | CTRL = GND | | 90 | | μ A |
| V_{FB} | RSET Pin Voltage | 2 LEDs with $I_{LED} = 300$ mA | 1.15 | 1.2 | 1.25 | V |
| I_{LED} | Programmed LED Current | R1 = 33 k Ω R1 = 10 k Ω R1 = 8.25 k Ω | 270 | 100 300 350 | 330 | mA |
| $V_{CTRL-FULL}$ | CTRL Voltage for 100% Brightness | | | 2.6 | 3.1 | V |
| $V_{CTRL-EN}$ | CTRL Voltage to Enable LEDs | LED enable voltage threshold | | 0.9 | 1.2 | V |
| $V_{CTRL-SD}$ | CTRL Voltage to Shutdown LEDs | LED disable voltage threshold | 0.4 | 0.9 | | V |
| I_{CTRL} | CTRL pin input bias | $V_{CTRL} = 3$ V $V_{CTRL} = 12$ V | | 40 200 | 80 | μ A |
| R_{SW} | Switch "On" Resistance | $I_{SW} = 300$ mA | | 0.9 | 1.5 | Ω |
| T_{SD} | Thermal Shutdown | | | 150 | | °C |
| T_{HYST} | Thermal Hysteresis | | | 20 | | °C |
| η | Efficiency | Typical Application Circuit | | 86 | | % |

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

External Component Selection

Table 4 provides the recommended external components L and C2 that offer the best performance relative to the LED current accuracy, LED ripple current, switching frequency and component size.

Table 4. EXTERNAL COMPONENT SELECTION

| LED Current (mA) | 1 LED | | 2 LEDs | |
|------------------|------------------------------|--------------------------------|------------------------------|--------------------------------|
| | L Inductor (μH) | C2 Capacitor (μF) | L Inductor (μH) | C2 Capacitor (μF) |
| ≥ 150 | 22 | 4.7 | 22 | 4.7 |
| < 150 | 33 | 4.7 | 47 | 2.2 |
| | 47 | 10 | | |

NOTE: Larger C2 capacitor values allow to reduce further the LED ripple current if needed.

Table 5. INDUCTOR SELECTION DEPENDING ON VBAT SUPPLY VOLTAGE

| VBAT Supply Voltage (V) | Minimum Inductor L (μH) |
|-------------------------|--------------------------------------|
| < 26 | 22 |
| ≥ 26 | 33 |

Table 6. PIN DESCRIPTION

| Pin | Name | Function |
|-----|------|---|
| 1 | CTRL | Analog dimming control and shutdown pin. |
| 2 | GND | Ground reference. |
| 3 | RSET | RSET pin. A resistor connected between the pin and ground sets the average LED current. |
| 4 | SW | Interface to the inductor. |
| 5 | VBAT | Supply voltage for the device. |

Pin Function

VBAT is the supply input to the device. Typical current conduction into this pin is less than 1 mA and voltage transients of up to 40 V can be applied. To ensure accurate LED current regulation, the VBAT voltage should be 3 V higher than the total forward voltage of the LED string. A bypass capacitor of 4.7 μ F or larger is recommended between VBAT and GND.

CTRL is the analog dimming and control input. An internal pull-down current of 20 μ A allows the LEDs to shutdown if CTRL is left floating. Voltages of up to 40 V can be safely handled by the CTRL input pin.

When the CTRL voltage is less than 0.9 V (typ), the LEDs will shutdown to zero current. When the CTRL voltage is greater than about 2.6 V, full scale brightness is applied to the LED output. At voltages of less than around 2.6 V, the LED current is progressively dimmed until shutdown.

For lamp replacement applications, or applications where operation in dropout mode is expected, it is recommended

that the CTRL pin voltage be derived from the LED cathode terminal.

GND is the ground reference pin. This pin should be connected directly to the ground plane on the PCB.

SW pin is the drain terminal of the internal low resistance high-voltage power MOSFET. The inductor and the Schottky diode anode should be connected to the SW pin. Voltages of up to 40 V can be safely handled on the SW pin. Traces going to the SW pin should be as short as possible with minimum loop area. The device can handle safely “open-LED” or “shorted-LED” fault conditions.

RSET pin is regulated at 1.2 V. A resistor connected between the RSET pin and ground sets the LED full-scale brightness current. The external resistance value and the CTRL pin voltage determine the LED current during analog dimming. The RSET pin must not be left floating. The highest recommended resistor value between RSET and ground is 90 k Ω .

CAT4201

Simplified Block Diagram

Figure 22. CAT4201 Simplified Block Diagram

Basic Operation

The CAT4201 is a high efficiency step-down regulator designed to drive series connected high-power LEDs. LED strings with total forward voltages of up to 32 V can be driven with bias currents of up to 350 mA.

During the first switching phase, an integrated high voltage power MOSFET allows the inductor current to charge linearly until the peak maximum level is reached, at which point the MOSFET is switched off and the second phase commences, allowing the inductor current to then flow through the Schottky diode circuit and discharge linearly back to zero current.

The switching architecture ensures the device will always operate at the cross-over point between Continuous Conduction Mode (CCM) and Discontinuous Conduction Mode (DCM). This operating mode results in an average LED current which is equal to half of the peak switching current.

LED Pin Current

The LED current is set by the external RSET resistor connected to the regulated output of the RSET pin. An overall current gain ratio of approximately 2.5 A/mA exists between the average LED current and the RSET current, hence the following equation can be used to calculate the LED current.

$$\text{LED Current (A)} \cong 2.5 \times \frac{V_{\text{RSET}} \text{ (V)}}{R_{\text{SET}} \text{ (k}\Omega\text{)}}$$

Table 7 lists the various LED currents and the associated RSET resistors.

Table 7. RSET RESISTOR SELECTION

| LED Current (A) | RSET (kΩ) |
|-----------------|-----------|
| 0.10 | 33 |
| 0.15 | 21 |
| 0.20 | 15 |
| 0.25 | 12 |
| 0.30 | 10 |
| 0.35 | 8.25 |

APPLICATION INFORMATION

Input Voltage Range

The minimum supply voltage required to maintain adequate regulation is set by the cathode terminal voltage of the LED string (i.e., the VBAT voltage minus the LED string voltage). When the LED cathode terminal falls below 3 V, a loss of regulation occurs.

For applications which may occasionally need to experience supply “dropout” conditions, it is recommended that the CTRL input be used to sense the LED cathode voltage. The CTRL pin can either be tied directly to the cathode terminal (for Lamp Replacement) or connected via a pass-transistor for PWM lighting applications.

Figure 23 shows the regulation performance obtained in dropout, when the CTRL pin is configured to sense the LED cathode voltage.

Figure 23. “Dropout” Configured LED Current
(as shown in Typical Application on page 1)

Inductor Selection

A 22 μH minimum inductor value is required to provide suitable switching frequency across a wide range of input supply values. For LED current of 150 mA or less, a 33 μH or 47 μH inductor is more suitable. Inductor values below 22 μH should not be used.

An inductor with at least 700 mA current rating must be used. Minor improvements in efficiency can be achieved by selecting inductors with lower series resistance.

Table 8. SUMIDA INDUCTORS

| Part Number | L (μH) | I Rated (A) | LED Current (A) |
|--------------|--------|-------------|-----------------|
| CDRH6D26-220 | 22 | 1.0 | 0.35 |
| CDRH6D28-330 | 33 | 0.92 | 0.35 |
| CDRH6D28-470 | 47 | 0.8 | 0.35 |
| CDRH6D28-560 | 56 | 0.73 | 0.35 |

Capacitor Selection

A 10 μF ceramic capacitor C2 across the LED(s) keeps the LED ripple current within ±15% of nominal for most applications. If needed, a larger capacitor can be used to further reduce the LED current ripple. Any resistance in series with the LED (0.5 Ω or more) contributes to reduce the ripple current. The capacitor voltage rating should be equivalent to the maximum expected supply voltage so as to allow for “Open-LED” fault conditions. The capacitor value is independent of the switching frequency or the overall efficiency.

A 4.7 μF ceramic input capacitor C1 is recommended to minimize the input current ripple generated on the supply. Using a larger capacitor value further reduces the ripple noise appearing on the supply rail.

If a constant capacitance is needed across temperature and voltage, X5R or X7R dielectric capacitors are recommended.

Schottky Diode

The peak repetitive current rating of the Schottky diode must be greater than the peak current flowing through the inductor. Also the continuous current rating of the Schottky must be greater than the average LED current. The voltage rating of the diode should be greater than the peak supply voltage transient preventing any breakdown or leakage. ON Semiconductor Schottky diode MBR0540 (40 V, 500 mA rated) is recommended. Schottky diodes rated at 400 mA (or higher) continuous current are fine for most applications.

NOTE: Schottky diodes with extremely low forward voltages (V_F) are not recommended, as they may cause an increase in the LED current.

Dimming Methods

Two methods for PWM dimming control on the LEDs are described below. The first method is to PWM on the control pin, the other method is to turn on and off a second resistor connected to the RSET pin and connected in parallel with R1.

PWM on CTRL Pin

A PWM signal from a microprocessor can be used for dimming the LEDs when tied to the CTRL pin. The duty cycle which is the ratio between the On time and the total cycle time sets the dimming factor. The recommended PWM frequency on the CTRL pin is between 100 Hz and 2 kHz.

Figure 24. PWM at 1 kHz on CTRL Pin

CAT4201

Figure 25. LED Current vs. Duty Cycle

Figure 26. Circuit for PWM on CTRL

PWM on RSET Pin

Another dimming method is to place in parallel to R1 another resistor with a FET in series, as shown on Figure 27. R1 sets the minimum LED current corresponding to 0% duty cycle. The combined resistor of R1 and Rmax sets the maximum LED current corresponding to 100% duty cycle.

Figure 27. Circuit for PWM on RSET

A resistor value for R1 of less than 90 kΩ is recommended to provide better accuracy.

Operation from High Supply Voltage Above 14 V

For operation from a supply voltage above 14 V, it is recommended to have a slew rate of 1 μs or more for every 5 V increase in VBAT supply. When using a high supply voltage of 24 V, a 1 Ω or 2 Ω resistor in series with the supply, as shown on Figure 28, is recommended to limit the slew rate of the supply voltage. A 4.7 μF minimum ceramic capacitor is placed between the VBAT pin and ground. The combination of the series resistor R3 and input capacitor C1 acts as a low pass filter limiting the excessive in-rush currents and overvoltage transients which would otherwise occur during “hot-plug” conditions, thereby protecting the CAT4201 driver.

Figure 28. 24 V Application with 5 LEDs

Operation from High Supply Voltage of 36 V

When powering from a high supply voltage of 36 V, a 2 Ω resistor in series with the supply is recommended, as shown on Figure 29, to limit the slew rate of the supply voltage. Inductor value should be 33 μH or higher.

Figure 29. 36 V Application with 6 LEDs

Parallel Configuration for Driving LEDs Beyond 350 mA

Several CAT4201 devices can be connected in parallel for driving LEDs with current in excess of 350 mA. The CAT4201 driver circuits are connected to the same LED cathode. Figure 30 shows the application schematic for driving 1 A into one LED with three CAT4201 connected in parallel. Each CAT4201 is driving the LED with a current set by its RSET resistor. The resulting LED current is equal to the sum of each driver current.

CAT4201

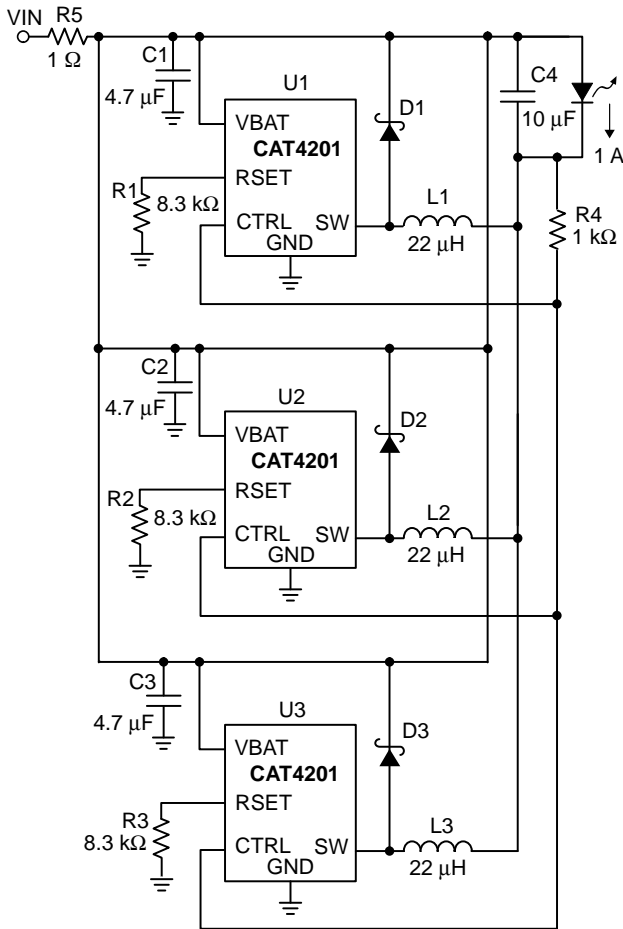

Figure 30. Three CAT4201 in Parallel for 1 A LED

Open LED Behavior

If the LEDs are not connected, the CAT4201 stops switching and draws very little current.

At power-up with no load connected, the capacitor C2 is charged-up by the CAT4201. As soon as the bottom side of the capacitor (C2-) reaches 0 volt, as shown on Figure 31, the CAT4201 stops switching and remains in the idle mode only drawing about 0.4 mA current from the supply.

Figure 31. Open LED Mode

Board Layout

In order to minimize EMI and switching noise, the Schottky diode, the inductor and the output capacitor C2 should all be located close to the driver IC. The input capacitor C1 should be located close to the VBAT pin and the Schottky diode cathode. The CAT4201 ground pin should be connected directly to the ground plane on the PCB. A recommended PCB layout with component location is shown on Figure 32. The LEDs are connected by two wires tied to both sides of the output capacitor C2. The LEDs can be located away from the driver if needed.

Figure 32. Recommended PCB Layout

In order to further reduce the ripple on the supply rail, an optional Pi style filter (C-L-C) can be used. A 10 μH inductor rated to the maximum supply current can be used.
