## Robust Digital Isolators with precise timing and low power consumption

### Description

The ISOFACE™ 4DIRx4xxH quad-channel digital isolator family supports data rates up to 40 Mbps and ensures robust data communication over a wide ambient operating temperature range (-40°C to +125°C) and across production spread. Infineon's robust Coreless Transformer (CT) technology provides high immunity against system noise (CMTI of min. 100 kV/μs) and withstands up to 5700 V<sub>rms</sub> isolation voltage (V<sub>ISO</sub>). Four data channels in a PG-DSO-16 wide-body 300 mil package allow simplified and high power density designs and improve system efficiency with low power consumption. Product variants with different channel configurations and fail-safe default output states are available.

### Features

- Data rates up to 40 Mbps
- Wide operating supply voltage 2.7 V - 6.5 V
- Low current consumption (max. 1.6 mA/ch @ 1 Mbps, 3.3 V, 15 pF)
- High CMTI of min. 100 kV/μs
- Propagation delay typ 26 ns with 3 ns channel-to-channel mismatch
- Max 3 ns pulse width distortion @ 3.3 V
- Variable CMOS input thresholds with default output high or low options
- RoHS compliant PG-DSO-16 wide-body 300 mil package

### Isolation and safety certificates

- UL 1577 (Ed. 5) with V<sub>ISO</sub> = 5700 V<sub>rms</sub> (certification n. E311313)
- VDE 0884-17 <sup>1)</sup> and IEC 60747-17 with V<sub>IOTM</sub> = 8000 V<sub>pk</sub>, V<sub>IORM</sub> = 1131 V<sub>pk</sub>, V<sub>IOSM</sub> = 6875 V<sub>pk</sub> <sup>2)</sup>
- EN and CQC certification for IEC 62368-1, IEC 60601-1, IEC 61010-1, GB 4943.1 system standards <sup>2)</sup>

### Product validation

Fully qualified according to JEDEC for industrial applications.

### Potential applications

- Server, telecom and Industrial Switch-Mode Power Supplies (SMPS)
- Industrial automation systems
- Motor drives
- Medical equipments
- Isolated Serial Peripheral Interface (SPI)

<sup>1</sup> IEC 60747-17 and its German equivalent VDE 0884-17 is the successor of the component standard VDE 0884-11, which will expire in 2023

**3.3 Data transmission input-to-output**

Communication based on Coreless Transformer (CT) is used for signal transfer between input and output channels. If a constant DC level within the operating range is applied at the input, a proven high resolution pulse repetition scheme ensure functionality, enabling the output to follow the constant DC input. It also enables recovery from communication fails and safe system shutdown. In case of a power loss at the input channel, the pulse repetition scheme will be disabled and a watch-dog timer at the output triggers approximately after  $t_{DO}$  time period and drives the channel output to the default state. In case of multiple channels on the output side, the first watch-dog timer detecting the power loss at the input will drive all output channels on that side to default value. Once the power supply on the input channels is above the threshold value ( $V_{DDX(UVLOon)}$ ), the communication is restored and the output will follow the input as shown in Figure 17.

## 4 Thermal and electrical characteristics

### 4.7 Electrical characteristics

The electrical characteristics involve the spread of values given within the specified operating conditions.

#### 4.7.1 Electrical characteristics - 6.5 V supply

Typical values are given at  $T_A = 25\text{ °C}$  with  $V_{DD1} = V_{DD2} = 6.5\text{ V}$ . Minimum/maximum specifications apply over the entire recommended operation range of  $V_{DD1} = V_{DD2} = 6.5\text{ V}$ , and  $-40\text{ °C} \leq T_A \leq 125\text{ °C}$ , unless otherwise noted. Switching characteristics are tested with  $C_{LOAD} = 15\text{ pF}$  and 50% duty-cycle input square wave, over operating range unless otherwise specified. Supply current values are specified considering that all channels are switching at the same data rate. Parameters are not tested in production unless otherwise specified.

- 1) The parameter gives the difference in propagation delay between different samples switching in the same direction under same conditions, including same ambient temperature
- 2) Also known as pulse skew. The parameter gives the maximum difference between on and off propagation delay shown from the same sample over the operating temperature range
- 3)  $V_{DD1}$  = Input-side supply voltage. For input channels on side 1 it is  $V_{DD1}$  and for input channels on side 2 it is  $V_{DD2}$
- 4) Parameter not tested in production

**4 Thermal and electrical characteristics**

**4.7.3 Electrical characteristics - 3.3 V supply**

Typical values are given at  $T_A = 25\text{ °C}$ ,  $V_{DD1} = V_{DD2} = 3.3\text{V}$ . Minimum/maximum specifications apply over the entire recommended operation range of  $V_{DD1} = V_{DD2} = 3.3\text{ V} \pm 10\%$ , and  $-40\text{ °C} \leq T_A \leq +125\text{ °C}$ , unless otherwise noted. Switching characteristics are tested with  $C_{LOAD} = 15\text{ pF}$  and 50% duty cycle input square wave, over operating range unless otherwise specified. Supply current values are calculated considering all channels are switching at the same data rate. Parameters are tested in production unless otherwise specified. Only DC supply currents are tested in production and the AC supply currents are not tested in production.

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
Output enable propagation delay (high-impedance to low output)	$t_{PD,ZL}$			13	ns	From 50% of rising enable (except 4DIR142xH) to 50% of falling $V_{OH}$ From 50% of falling enable (for 4DIR142xH) to 50% of falling $V_{OH}$
Default output delay time from input power loss	$t_{DO}$		0.4	2.6	$\mu$ s	Measured from $V_{DDIUVLOoff} = 2.55$ V. Power supply ramp rate = 1 V/ $\mu$ s <sup>1)</sup>
Time from UVLO to valid output data	$t_{PU}$			3	$\mu$ s	Power supply ramp rate = 1 V/ $\mu$ s, DR > 6.6 Mbps

- 1) Parameter tested in production
- 2) The parameter gives the difference in propagation delay between different samples switching in the same direction under same conditions, including same ambient temperature
- 3) Also known as pulse skew. The parameter gives the maximum difference between on and off propagation delay shown from the same sample over the operating temperature range
- 4)  $V_{DD1}$  = Input-side supply voltage. For input channels on side 1 it is  $V_{DD1}$  and for input channels on side 2 it is  $V_{DD2}$

1) Creepage and clearance requirements depend on the application and related end-equipment isolation standard. Care should be taken to keep the required creepage and clearance value on printed circuit board level.

2) Safety certification planned. The IEC 60747-17 and its German equivalent VDE 0884-17 is the successor of the component standard VDE 0884-11, which will expire in 2023.

3) The partial discharge voltage  $V_{PD(m)}$  applied during productive tests is greater ( $4411$  V<sub>pk</sub> >  $1.875 \times V_{IORM}$ ) to include the  $F_4$  factor (1.1) that takes into account the maximum deviation of the mains supply voltage from its nominal value as specified by end-equipment standards IEC 60664-1, IEC 62368-1 ( $V_{PD(m)} = F_1 \times F_2 \times F_3 \times F_4 \times V_{IORM} = 1.875 \times F_4 \times V_{IORM}$ ). The  $F_3$  factor (1.25) is also considered for reinforced isolation as specified in IEC 60664-1.

4) The surge test is performed in insulation oil to determine the intrinsic surge immunity of the insulation barrier.

5) The parameters apply to the product converted in a two terminals device with all terminals on side 1 connected together and all terminals on side 2 connected together.

6) Parameter not tested in production.

**Green product (RoHS-compliant)**

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations, the device is available as a green product. Green products are RoHS-compliant (i.e they have Pb-free finish on leads and are suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
